

QuickSearchContacts

Last Modified on 11/01/2017 9:52 am CDT

Overview

Lists contact or contacts based on information sent via an http form post.

Special Notes

This function is designed for speed – searching only First Name, Last Name, Other First Name, Other Last Name, Email Address, and Other Email Address. It also returns only a limited number of fields and is limited to 50 results returned. This would be best used in some kind of “type-along-find” Ajax contact picker. Lower the “max results” to an even lower number to speed up the results even further.

Update 6/1/2017 – When the **searchstring** contains a space, the search will split the field in two and assume that it is a “first name+last name” “begins with” search. A **searchstring** of “jo sm” with search for contacts with first names beginning with “jo” and last names beginning with “sm”
